Fully Loaded Time: 1.0s
Total Page Size: 443KB
Requests: 23
Improvements

**Page Load Time**
Old Site: 17.7 seconds  
New Optimized Site: 1.0 seconds

The lower the page load time the better, as per recent Google Studies any website that takes over 3 seconds to load loses 1/3 of its visitors.

**PageSpeed Score**
Old Site: 68 (D)  
New Optimized Site: 100 (A)

This is Google's Algorithm to analyze a webpage based on its best practices, the higher the score the better optimized the webpage which then gets Google's PageSpeed benefits as Google considers the website well optimized and ranks it better.

**YSlow Score**
Old Site: 68 (D)  
New Optimized Site: 98 (A)

Another Pagespeed scoring algorithm similar to Google PageSpeed but with different thresholds and key areas.

**Requests**
Old Site: 154  
New Optimized Site: 23

High requests count makes the webpage heavier on the visitor's computer/mobile as it has to make a high number of requests to load the page, this increases load times significantly if the visitor is using a slower internet connection and also increase loads on the server further decreasing the performance if the website has multiple visitors.
**Time To First Byte**
Old Site: 2.9 seconds  
New Optimized Site: 174 milliseconds

This is how long the server takes to respond with the First Byte of information to the visitor. When the visitor requests a webpage the server starts getting the page ready by loading the page and its database queries and starts sending information in pieces, TTFB is the time it takes for that first piece of information to reach the visitor. The lower it is the better.

**Page Size**
Old Site: 2.97 MB  
New Optimized Site: 443 KB

This is the size of the Page which is loaded on initialization of the website, the higher this is the more time it would take and would also take more resources on the visitor's end. Well optimized sites tend to ensure Page Size is under 3MB to ensure webpage loads fast and takes minimum resources.
